

NORTHERN US & EASTERN CANADA (ZONES 2-4)

We know, we know, your last frost date can be as late as late May, but don't let that keep you from getting started in your garden! Preparing the soil in beds can be done as soon as thaw has occurred and when it stops raining. Focus on plants that can take colder weather and still grow or bloom. This might mean covering them on the coldest nights, or moving plants in and out of a garage for the last few spring freezes, but getting an early start can really help when your summers are short.
